

Coiled Tubing Operations Support CTOS

Comprehensive Technical Support for Coiled Tubing Operations

- CT job design
- Evaluate bid tenders & proposals
- Determine suitability of projects for CT
- Post-job analyses & investigations
- Data acquisition and analyses
- Specifications, manuals & guidelines
- Research and testing
- Training

CTES is uniquely equipped with experienced engineers and state-of-the-art software to provide **comprehensive technical support** for your CT operations. We can add value to each CT operation by maximizing your chances for success. **Offsite**, CTES can design your CT job or help you optimize an existing job design. **Onsite**, CTES can support execution of the job design with technical guidance or up-to-the-minute revisions to the design.

Software Tools

With the aid of our powerful **Cerberus**[™] software, CTES engineers can design your CT job to optimize the performance of a specified CT string or design the most appropriate string for a given job. The Cerberus suite of programs includes the following:

Orpheus[™] - CT forces and buckling

CTES engineers use Orpheus to calculate drag and helical buckling, determine the maximum setdown weight and overpull at a specified depth, and estimate the surface weight as the tubing runs into and out of the well.

Hercules[™] - CT operating limits

CTES engineers use Hercules to calculate the CT operating limits of burst and collapse pressures and maximum axial forces.

Hydra[™] - CT hydraulics performance

CTES realizes the critical nature of designing CT operations to deliver a specific hydraulic performance. Hydra allows our engineers to calculate and monitor the pressure and flow rate of fluids at any location in the CT and wellbore.

Reel-Trak[™] & **Achilles**[™] - CT fatigue management

CTES engineers use Reel-Trak with its sophisticated fatigue model, Achilles, to design jobs in a way that will prolong the useful life of your CT string.

Operations Support

- › If you are planning a new well for CT drilling or intervention, CTES can evaluate its suitability for CT operations and suggest refinements to the well's path or completion that would improve your chances for success.
- › Should a job develop problems, CTES can work with your personnel as an impartial third party to diagnose the source(s) of the problems and recommend a remedy. We have the expertise and resources to analyze operations data, investigate hardware failures, and evaluate actions taken by personnel on the job. CTES can help you improve both the quality standards and the procedures applied to your CT operations.
- › If you are an oil company seeking a qualified service company to provide CT services, CTES can assist your search. Our experienced staff can write bid specifications and qualification questionnaires, design evaluation schemes, and develop audit criteria.
- › If your service company is a candidate for a contract, CTES training and guidance can improve your chances for meeting the selection criteria.
- › CTES has conducted numerous successful joint industry and contract research projects on a wide spectrum of CT technology problems. We are eminently qualified to assist you with your research and testing projects ranging from small-scale lab experiments to full-scale field tests.

These sophisticated tools help CTES engineers to analyze each CT job for sensitivity to:

- Well path tortuosity or doglegs
- Wellbore geometry
- Wellbore friction
- Maximum working depth
- BHA size and weight
- Internal wireline (cable)
- CT diameter and taper design
- CT material selection
- Setdown weight and overpull
- Fluids inside and outside the CT
- Pressure inside and outside the CT
- Total string weight
